

# Cheat Sheet: Generative AI Overview and Data Preparation

Package/Method	Description	Code example
NLTK	NLTK is a Python library used in natural language processing (NLP) for tasks such as tokenization and text processing. The code example shows how you can tokenize text using the NLTK word-based tokenizer.	<pre>1. 1 2. 2 3. 3 4. 4 5. 5 6. 6</pre>
		<pre>1. import nltk 2. nltk.download("punkt") 3. from nltk.tokenize import word_tokenize 4. text = "Unicorns are real. I saw a unicorn yesterday. I couldn't see it today." 5. token = word_tokenize(text) 6. print(token)</pre>
spaCy	spaCy is an open-source library used in NLP. It provides tools for tasks such as tokenization and word embeddings. The code example shows how you can tokenize text using spaCy word-based tokenizer.	<div>Copied!</div> <pre>1. 1 2. 2 3. 3 4. 4 5. 5 6. 6</pre>
		<pre>1. import spacy 2. text = "Unicorns are real. I saw a unicorn yesterday. I couldn't see it today." 3. nlp = spacy.load("en_core_web_sm") 4. doc = nlp(text) 5. token_list = [token.text for token in doc] 6. print("Tokens:", token_list)</pre>
BertTokenizer	BertTokenizer is a subword-based tokenizer that uses the WordPiece algorithm. The code example shows how you can tokenize text using BertTokenizer.	<div>Copied!</div> <pre>1. 1 2. 2 3. 3</pre>
		<pre>1. from transformers import BertTokenizer 2. tokenizer = BertTokenizer.from_pretrained("bert-base-uncased") 3. tokenizer.tokenize("IBM taught me tokenization.")</pre>
XLNetTokenizer	XLNetTokenizer tokenizes text using Unigram and SentencePiece algorithms. The code example shows how you can tokenize text using XLNetTokenizer.	<div>Copied!</div> <pre>1. 1 2. 2 3. 3</pre>
		<pre>1. from transformers import XLNetTokenizer 2. tokenizer = XLNetTokenizer.from_pretrained("xlnet-base-cased") 3. tokenizer.tokenize("IBM taught me tokenization.")</pre>
torchtext	The torchtext library is part of the PyTorch ecosystem and provides the tools and functionalities required for NLP. The code example shows how you can use torchtext to generate tokens and convert them to indices.	<div>Copied!</div> <pre>1. 1 2. 2 3. 3 4. 4 5. 5 6. 6 7. 7 8. 8 9. 9 10. 10 11. 11 12. 12 13. 13 14. 14 15. 15 16. 16 17. 17 18. 18 19. 19 20. 20 21. 21 22. 22 23. 23 24. 24 25. 25 26. 26 27. 27 28. 28 29. 29 30. 30 31. 31</pre>
		<pre>1. from torchtext.vocab import build_vocab_from_iterator 2. # Defines a dataset 3. dataset = [ 4.     (1,"Introduction to NLP"), 5.     (2,"Basics of PyTorch"), 6.     (1,"NLP Techniques for Text Classification"), 7.     (3,"Named Entity Recognition with PyTorch"), 8.     (3,"Sentiment Analysis using PyTorch"), 9.     (3,"Machine Translation with PyTorch"), 10.    (1,"NLP Named Entity,Sentiment Analysis, Machine Translation"), 11.    (1,"Machine Translation with NLP"), 12.    (1,"Named Entity vs Sentiment Analysis NLP")] 13. # Applies the tokenizer to the text to get the tokens as a list 14. from torchtext.data.utils import get_tokenizer 15. tokenizer = get_tokenizer("basic_english") 16. tokenizer(dataset[0][1]) 17. # Takes a data iterator as input, processes text from the iterator,</pre>

Package/Method	Description	Code example
vocab	The vocab object is part of the PyTorch torchtext library. It maps tokens to indices. The code example shows how you can apply the vocab object to tokens directly.	<pre> 18. # and yields the tokenized output individually 19. def yield_tokens(data_iter): 20.     for _,text in data_iter: 21.         yield tokenizer(text) 22. # Creates an iterator 23. my_iterator = yield_tokens(dataset) 24. # Fetches the next set of tokens from the data set 25. next(my_iterator) 26. # Converts tokens to indices and sets &lt;unk&gt; as the 27. # default word if a word is not found in the vocabulary 28. vocab = build_vocab_from_iterator(yield_tokens(dataset), specials=["&lt;unk&gt;"]) 29. vocab.set_default_index(vocab["&lt;unk&gt;"]) 30. # Gives a dictionary that maps words to their corresponding numerical indices 31. vocab.get_stoi()</pre>
		<div>Copied!</div> <pre> 1. 1 2. 2 3. 3 4. 4 5. 5 6. 6 7. 7 8. 8 9. 9 10. 10 11. 11 12. 12 13. 13 14. 14</pre> <pre> 1. # Takes an iterator as input and extracts the next tokenized sentence. 2. # Creates a list of token indices using the vocab dictionary for each token. 3. def get_tokenized_sentence_and_indices(iterator): 4.     tokenized_sentence = next(iterator) 5.     token_indices = [vocab[token] for token in tokenized_sentence] 6.     return tokenized_sentence, token_indices 7. # Returns the tokenized sentences and the corresponding token indices. 8. # Repeats the process. 9. tokenized_sentence, token_indices = \ 10. get_tokenized_sentence_and_indices(my_iterator) 11. next(my_iterator) 12. # Prints the tokenized sentence and its corresponding token indices. 13. print("Tokenized Sentence:", tokenized_sentence) 14. print("Token Indices:", token_indices)</pre>
Special tokens in PyTorch: <eos> and <bos>	Special tokens are tokens introduced to input sequences to convey specific information or serve a particular purpose during training. The code example shows the use of <bos> and <eos> during tokenization. The <bos> token denotes the beginning of the input sequence, and the <eos> token denotes the end.	<div>Copied!</div> <pre> 1. 1 2. 2 3. 3 4. 4 5. 5 6. 6 7. 7 8. 8 9. 9 10. 10</pre> <pre> 1. # Appends &lt;bos&gt; at the beginning and &lt;eos&gt; at the end of the tokenized sentences 2. # using a loop that iterates over the sentences in the input data 3. tokenizer_en = get_tokenizer('spacy', language='en_core_web_sm') 4. tokens = [] 5. max_length = 0 6. for line in lines: 7.     tokenized_line = tokenizer_en(line) 8.     tokenized_line = ['&lt;bos&gt;'] + tokenized_line + ['&lt;eos&gt;'] 9.     tokens.append(tokenized_line) 10.    max_length = max(max_length, len(tokenized_line))</pre>
Special tokens in PyTorch: <pad>	The code example shows the use of <pad> token to ensure all sentences have the same length.	<div>Copied!</div> <pre> 1. 1 2. 2 3. 3</pre> <pre> 1. # Pads the tokenized lines 2. for i in range(len(tokens)): 3.     tokens[i] = tokens[i] + ['&lt;pad&gt;'] * (max_length - len(tokens[i]))</pre>
Dataset class in PyTorch	The Dataset class enables accessing and retrieving individual samples from a data set. The code example shows how you can create a custom data set and access samples.	<div>Copied!</div> <pre> 1. 1 2. 2 3. 3 4. 4 5. 5 6. 6 7. 7 8. 8 9. 9 10. 10 11. 11 12. 12 13. 13 14. 14 15. 15 16. 16 17. 17 18. 18 19. 19</pre> <pre> 1. # Imports the Dataset class and defines a list of sentences 2. from torch.utils.data import Dataset</pre>

Package/Method	Description	Code example
DataLoader class in PyTorch	A DataLoader class enables efficient loading and iteration over data sets for training deep learning models. The code example shows how you can use the DataLoader class to generate batches of sentences for further processing, such as training a neural network model	<pre> 3. sentences = ["If you want to know what a man's like, take a 4. good look at how he treats his inferiors, not his equals.", 5. "Fae's a fickle friend, Harry."] 6. # Downloads and reads data 7. class CustomDataset(Dataset): 8.     def __init__(self, sentences): 9.         self.sentences = sentences 10.     # Returns the data length 11.     def __len__(self): 12.         return len(self.sentences) 13.     # Returns one item on the index 14.     def __getitem__(self, idx): 15.         return self.sentences[idx] 16. # Creates a dataset object 17. dataset=CustomDataset(sentences) 18. # Accesses samples like in a list 19. E.g., dataset[0]</pre>
		<div>Copied!</div> <pre> 1. 1 2. 2 3. 3 4. 4 5. 5 6. 6 7. 7 8. 8 9. 9 10. 10 11. 11 12. 12 13. 13 14. 14</pre> <pre> 1. # Creates an iterator object 2. data_iter = iter(data_loader) 3. # Calls the next function to return new batches of samples 4. next(data_iter) 5. # Creates an instance of the custom data set 6. from torch.utils.data import DataLoader 7. custom_dataset = CustomDataset(sentences) 8. # Specifies a batch size 9. batch_size = 2 10. # Creates a data loader 11. data_loader = DataLoader(custom_dataset, batch_size=batch_size, shuffle=True) 12. # Prints the sentences in each batch 13. for batch in data_loader: 14.     print(batch)</pre>
Custom collate function in PyTorch	The custom collate function is a user-defined function that defines how individual samples are collated or batched together. You can utilize the collate function for tasks such as tokenization, converting tokenized indices, and transforming the result into a tensor. The code example shows how you can use a custom collate function in a data loader.	<div>Copied!</div> <pre> 1. 1 2. 2 3. 3 4. 4 5. 5 6. 6 7. 7 8. 8 9. 9 10. 10 11. 11 12. 12 13. 13</pre> <pre> 1. # Defines a custom collate function 2. def collate_fn(batch): 3.     tensor_batch = [] 4.     # Tokenizes each sample in the batch 5.     for sample in batch: 6.         tokens = tokenizer(sample) 7.     # Maps tokens to numbers using the vocab 8.     tensor_batch.append(torch.tensor([vocab[token] for token in tokens])) 9.     # Pads the sequences within the batch to have equal lengths 10.    padded_batch = pad_sequence(tensor_batch, batch_first=True) 11.    return padded_batch 12. # Creates a data loader using the collate function and the custom dataset 13. data_loader = DataLoader(custom_dataset, batch_size=batch_size, shuffle=True, collate_fn=collate_fn)</pre>
